Structure

- The Challenge
- Background
- The Hypothesis
- Proposed Architecture
 - Metadata
 - Workflow
 - Architectural Solution
- Conclusion

The Challenge

- THE ACCUSATION
 - GL documents (objects) lack transparency
 - (and implicitly quality)
- THE SOLUTION
 - Formal metadata
 - Workflow
 - Recording provenance
 - Recording context

Transparency is defined in physics as the property of allowing light to pass through a material while more generally it implies openness, communication, and accountability. The latter meaning is used in this paper.

Contention: Metadata

Dublin Core (DC) and (MARC)

– are insufficient for the purposes of:

Explanation w.r.t. GOs
(Grey Objects)

- Discovery
 - Management
 - Utilisation
 - Understanding
 - Re-purposing
 - Contextualising
 - Provenance
 - Preservation/curation
 - Quality assessment
- Existence of relevant GOs
 - Organising optimally GOs
 - Using GOs for research
 - The content of the GO
 - A different use of the GO
 - GO related to e.g. Project, group
 - The processing steps of the GO
 - GO available and understandable
 - Compare the GO

Contention: Workflow

- unless GL material is collected in the context of a research workflow of services acting on the GL:
- the threshold barrier to collection is high and discourages those producing the GL from providing the metadata (or even the source material);
- associated contextual information is lost including any quality controls or peer review, or information allowing reputational judgement – thus transparency, so essential for confidence and trust in the information, is also lost;

Background: Previous Work

- the need for **formal metadata** to allow machine understanding and therefore scalable operations (Jeffery 1999)
- the enhancement of repositories of grey (and other) e-publications by **linking with CRIS** (Jeffery and Asserson 2004)
- the use of the **research process** to collect metadata incrementally reducing the threshold barrier for end-users and improving quality in an ambient GRIDs environment (Jeffery and Asserson 2005)
- an architectural model for **scaleable, highly distributed, workflowed** repositories of GLbased on hyperactive 'intelligent' documents (Jeffery and Asserson 2006)
- 'Greyscape' based on the hypothesis that grey literature is the **foundation for the knowledge economy** (Jeffery and Asserson 2007)
- An analysis of **interoperation** architectures among research information systems 'INTEREST' (Jeffery and Asserson 2008).
- A proposal that Grey Literature should be seen within the **context of e-Science** supported by a CERIF-CRIS (Jeffery and Asserson 2009)

Hypothesis

The 'transparency problem' can be solved easily by two technologies for which implemented examples are used widely:

- formal metadata associated with grey literature repositories **improves relevance and quality**;
- recording the workflow phases of a grey object within the context of a research information system **records provenance**;

The solution – CERIF – exists already which covers these requirements.

→ **GLASS: Grey Literature Architecture for Sustainable Systems**

Architectural Solution

SERVICES

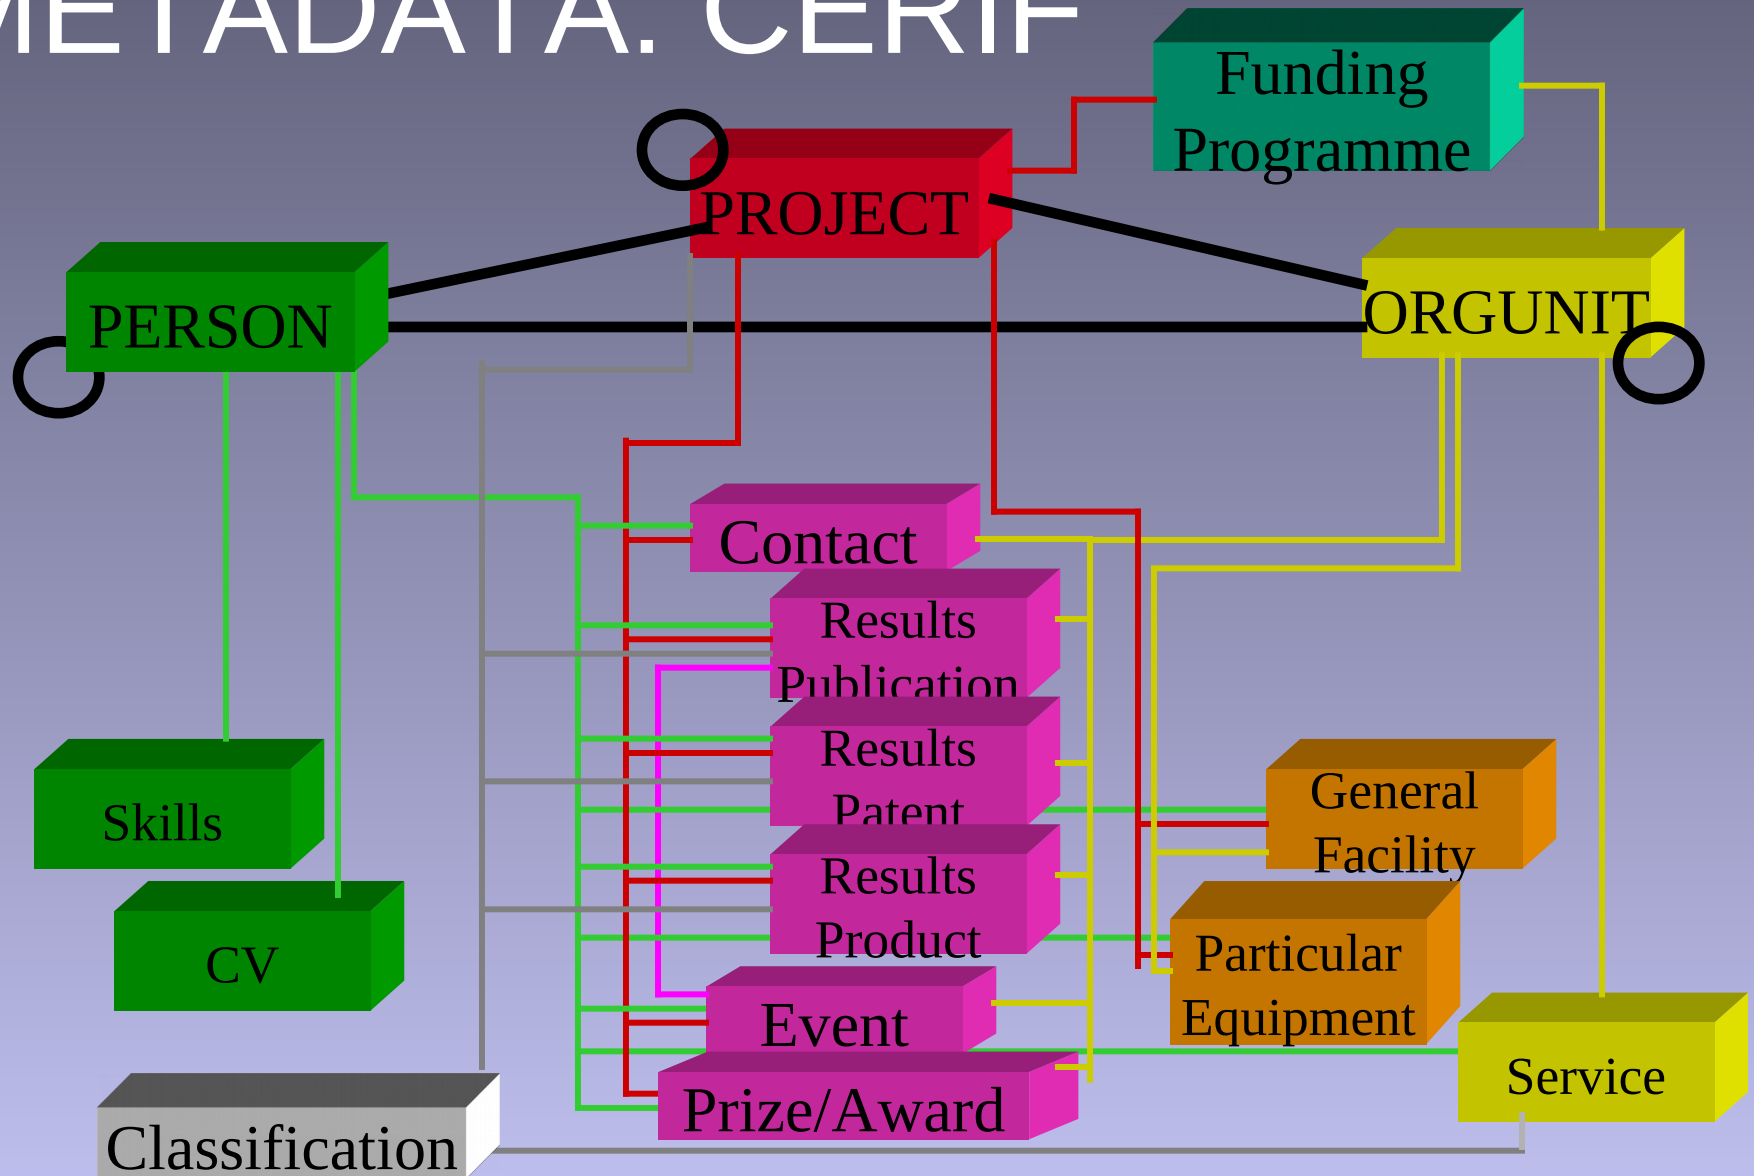

- Discovery
- Management
- Utilisation
- Understanding
- Re-purposing
- Contextualising
- Provenance
- Preservation/curation
- Quality Assessment

METADATA

- Schema
- Descriptive
- Restrictive
- Navigational
- Contextual
- Provenance
- Curation/Preservation

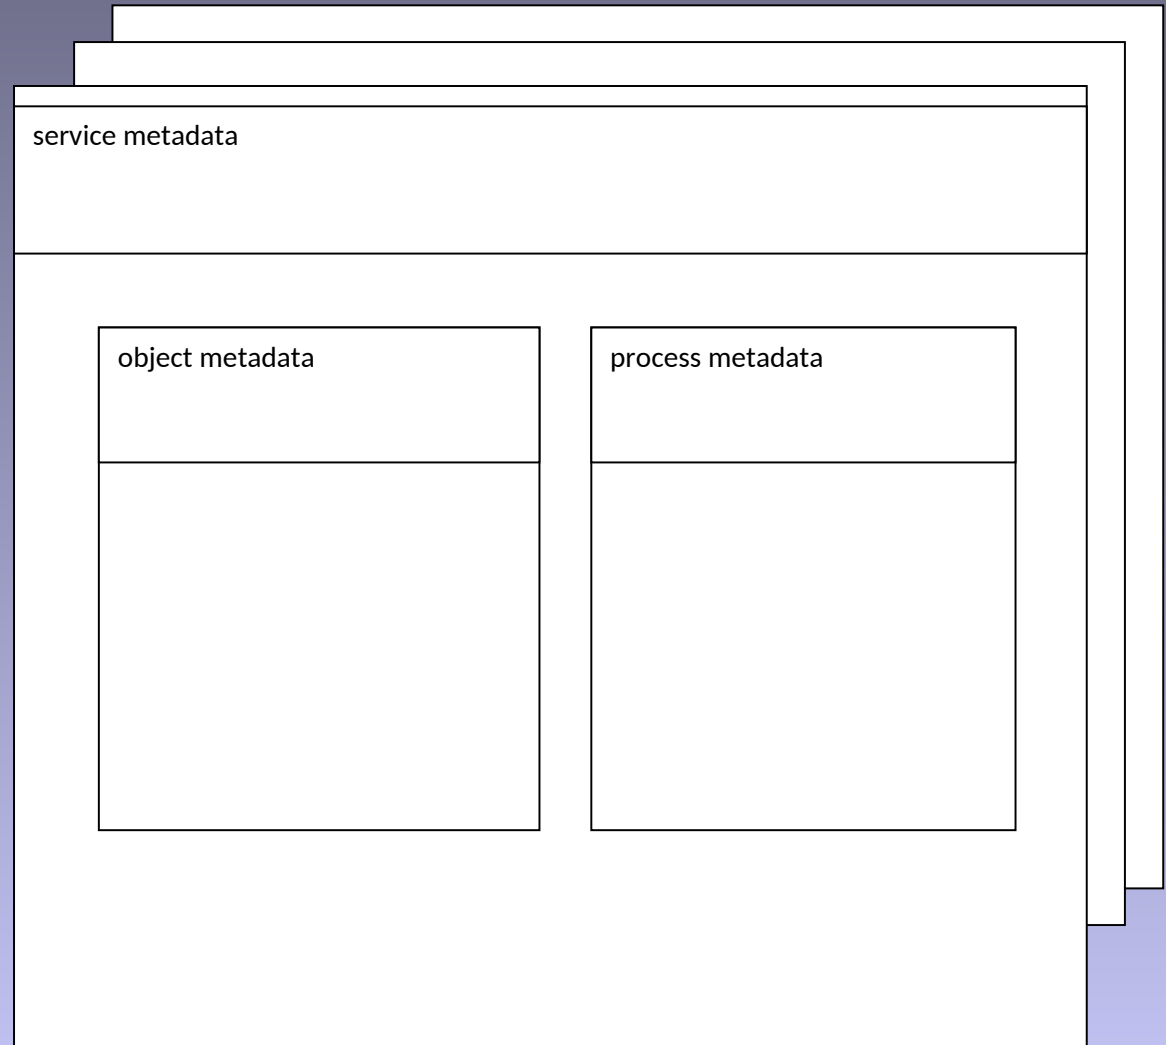

METADATA: CERIF

CERIF: EU Recommendation to Member States

WORKFLOW: SERVICES

- object-independent
i.e. generic processes
that act on
any data
- object-dependent
i.e. including
and
enclosing
the object(s)
together
with the
processes.

Conclusion

- The proposed GLASS architecture achieves transparency through several mechanisms:
- encouraging the provision of full metadata using CERIF to cover all aspects of **the grey data object** thus maximizing the potential utilisation and providing information relating to integrity and quality;
- encouraging the provision of full metadata using CERIF to cover all aspects of **services** thus maximizing the potential utilisation (including in composed services) and providing information relating to integrity and quality;
- through CERIF defining metadata with **formal syntax** (for reliable computer processing) and **declared semantics** (for computer or human understanding);
- through CERIF providing a data model which records the date/time interval associated with any relationship between two base entities. This provides automatically a **provenance** track and also can be used for non-functional aspects such as security, privacy, rights restrictions;
